

Acknowledgements

First of all, I would like to express my gratitude to my supervisor, Prof. dr. Rihard Karba, dipl. ing., from whom I received a lot of support during my study. His great interest in the subject encouraged me a lot during my research.

Deep thanks and gratefulness go to Prof. dr. Stanko Strmčnik whose invaluable help and encouragement contributed that this work was finished in time.

Special thanks and deep gratitude belong to dr. Youbin Peng and Prof. dr. Raymond Hanus from Free University of Brussels who are partly “guilty” that I fell in the subject of anti-windup and conditioned transfer techniques. I have to thank them also for their patience and a lot of valuable time they spent on our discussions. Without their support this work probably would not arise, at least not in the present form.

Also, I would like to give my thanks and gratitude to Đani Juričić and Janko Petrovčić whose invaluable contribution was in giving me additional practical and theoretical aspects of anti-windup and conditioned transfer techniques which rised up during our numerous discussions. Both of them I thank very much also for careful proof-reading of this work.

I would like to thank all the co-workers from the Department of Computer Automation and Control, J. Stefan Institute and colleagues from the Department of Control Engineering, Free University of Brussels. From them I received a lot of help during my work.

Financial support of my study from the Ministry of Science and Technology and my stay in Brussels from the TEMPUS office are gratefully acknowledged.

My deep gratefulness also goes to my family and all other people who supported me.
